

Westek Launches Monster Ultra Fast High Capacity iSCSI Storage System

Westeks new R8504i Power iSCSI system provides massive storage capacity and simply amazing performance.

With up to 50TBytes raw capacity in a single system and with a simply astonishing sustained read / write performance of up to 1.4GBytes per second for a fully configured unit in RAID 5 or RAID 6, the R8504i comfortably out performs traditional fibre channel systems and other iSCSI offerings.

The R8504i is available with up to 50 hot swap enterprise class SAS or SATA II disk drives

To facilitate the use of this phenomenal performance, dual 10 Gbit Ethernet ports are provided as standard (expandable). These would typically be connected to a non blocking switch using two uplink 10Gbit ports on the switch and then running multiple Gbit Ethernet links from the switch to up to 512 servers being provisioned with storage capacity.

The R8504 includes all the usual features of Westeks power iSCSI family including the time stamped snapshot feature and optional data replication and auto fail over to a second on or off site system. Automatic time stamped snapshot enables rapid recovery of deleted or corrupted files or data as well as providing an efficient backup solution off line.

Replication and seamless failover provides a real time second copy of all your data locally or at a remote location, coupled with automatic failover to the secondary unit to ensure continued data availability providing a simple DR solution.

The R8504i is available from all Westek partner storage resellers. Contact Westek for more information or visit our website at <http://www.westekuk.com/products>
